Abstract not available for DE 3418034 (A1)

Abstract of corresponding document: **EP 0161673 (A2)**

In a polarographic membrane-covered probe having a working electrode (1) and counter-electrode (2) as well as a reference electrode (3), control of the state of the operating time of the probe is effected by detecting the potential difference U_{RG} between reference electrode (3) and counter-electrode (2). The variation in the potential difference is used as a measure for assessing the state of the operating time of the probe.
